remove lsb

ie rax = rax − lsb(rax)

lowest 2^k-term from binary rax

ie removing rightmost set bit

```
mov     rdx, rax      rdx := rax₀
dec     rax           rax = rax₀ − 1
and     rax, rdx
```

$rax = rax \wedge rdx$
$= (rax_0 - 1) \wedge (rax_0)$

0...0

~~1~~000 0000

empirical gdb tests

16, 32, 64 → 0

~~0011~~ 3 → 2 0010

~~010~~ 5 → 4 0100

~~0001 0010~~ 0x12 = 18 → 10 0001 0000

~~100~~ 9 → 8 1000

~~0111~~ 7 → 6 0110

~~0110~~ 6 → 4 0100

ie removes the rightmost-bit
ie the lsb

ie rounds down

ie removes lowest 2^k term from rax's binary form

−(lsb(rax) value)

[0x2d]
