nop (that just mod. flags)

ie does nothing to rax

```
not     rax
inc     rax
neg     rax
```

not rax → logical negation
ie flips ∀ bit values

inc rax → increments counter

neg rax → 2's complement negation
ie invert + 1

eg)
a:=1011 0010
↓ not
0100 1101
↓ inc
0100 1110
↓ neg
1011 0001 + 1 = 1011 0010 = a
∴ f(a) → a
ie does nothing
